

Appl. No. 09/757,354  
Amdt. Dated August 18, 2004  
Reply to Office action mailed May 20, 2004

**Amendment to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

**Claim 1 (original):** An edit module comprising:

an edit program construction engine,  
wherein the edit program construction engine creates an edit program for a packet in response to a disposition decision for the packet, and wherein the edit program is applied to modify the packet.

**Claim 2 (original):** The edit module of claim 1 wherein the edit program includes a plurality of instructions, and wherein one or more instructions determine one or more data bits to be included in the modified packet.

**Claim 3 (original):** A method of modifying an inbound packet to generate an outbound packet, the method comprising the steps of:

creating an edit program for the inbound packet in response to a disposition decision for the inbound packet; and  
applying the edit program to the inbound packet to generate the outbound packet.

**Claim 4 (original):** The method of modifying an inbound packet of claim 3 wherein the edit program includes a plurality of instructions, and wherein the step of applying the edit program comprises the step of determining one or more data bits to be included in the outbound packet.

Appl. No. 09/757,354  
Amdt. Dated August 18, 2004  
Reply to Office action mailed May 20, 2004

**Claim 5 (currently amended):** A packet switching controller for processing an inbound packet, the packet switching controller comprising:

a first engine for constructing an edit program for the inbound packet in response to a disposition decision for the inbound packet;

a memory for storing the edit program; and

a second engine for executing the edit program to modify the inbound packet to and generate an outbound packet.

**Claim 6 (original):** The packet switching controller of claim 5 wherein the edit program includes a plurality of instructions, and one or more instructions determine a plurality of data bits to be included in the outbound packet.

**Claim 7 (original):** The packet switching controller of claim 5 wherein the edit program includes a plurality of instructions, and one or more instructions are for performing at least one operation selected from the group consisting of RECORD, PLAYBACK, COPY, DELETE, INSERT and OVERWRITE operations.

**Claim 8 (original):** The packet switching controller of claim 5 wherein the edit program includes a plurality of instructions that are executed serially.

**Claim 9 (original):** The packet switching controller of claim 5 wherein the second engine includes a packet input buffer for receiving and for temporarily storing the inbound packet.

**Claim 10 (original):** The packet switching controller of claim 9 wherein the inbound packet is stored in the packet input buffer until the edit program has been constructed for the inbound packet.

**Claim 11 (original):** The packet switching controller of claim 5 wherein the second engine includes a playback buffer for storing data from the inbound packet and for playing back at least a portion of the stored data.

Appl. No. 09/757,354  
Amdt. Dated August 18, 2004

**Claim 12 (original):** The packet switching controller of claim 5 wherein the second engine includes a packet output buffer, which is used to modify one or more bits of the inbound packet to generate the outbound packet, and to transmit the outbound packet.

**Claim 13 (currently amended):** A method of processing an inbound packet to generate an outbound packet using a real-time constructed edit program, the method comprising the steps of:

constructing the edit program for the inbound packet in response to a disposition decision for the inbound packet;

storing the edit program in a memory; and

modifying the inbound packet by executing the edit program to generate the outbound packet.

**Claim 14 (original):** The method of processing an inbound packet of claim 13 wherein the step of modifying the inbound packet includes the step of determining a plurality of data bits to be included in the outbound packet.

**Claim 15 (original):** The method of processing an inbound packet of claim 13 wherein the step of modifying the inbound packet includes the step of performing at least one operation selected from the group consisting of RECORD, PLAYBACK, COPY, DELETE, INSERT and OVERWRITE operations.

**Claim 16 (original):** The method of processing an inbound packet of claim 13 wherein the step of modifying the inbound packet includes the step of serially executing a plurality of instructions.

**Claim 17 (original):** The method of processing an inbound packet of claim 13 further comprising the steps of receiving the inbound packet and temporarily storing the inbound packet.

Appl. No. 09/757,354  
Amdt. Dated August 18, 2004  
Reply to Office action mailed May 20, 2004

**Claim 18 (original):** The method of processing an inbound packet of claim 17 wherein the inbound packet is stored until the edit program has been constructed for the inbound packet.

**Claim 19 (original):** The method of processing an inbound packet of claim 13 further comprising the steps of storing data from the inbound packet and playing back at least a portion of the stored data.

**Claim 20 (original):** The method of processing an inbound packet of claim 13 wherein the step of modifying the inbound packet includes the step of modifying one or more bits of the inbound packet.

**Claim 21 (currently amended):** A switch comprising a switching backplane and a plurality of packet switching controllers, one or more packet switching controllers comprising:

a buffer for receiving and storing an inbound packet;

a first engine for constructing an edit program in real-time using a disposition decision for the inbound packet; and

a second engine for executing the edit program to modify the inbound packet into an outbound packet,

wherein the packet switching controller that modifies the inbound packet transmits the outbound packet over the switching backplane to one or more of other packet switching controllers.

**Claim 22 (currently amended):** A switch comprising a switching backplane and a plurality of packet switching controllers, one or more packet switching controllers comprising:

means for receiving and storing an inbound packet;

means for constructing an edit program in real-time using a disposition decision for the inbound packet; and

means for executing the edit program to modify the inbound packet,

Appl. No. 09/757,354  
Amdt. Dated August 18, 2004  
Reply to Office action mailed May 20, 2004

wherein the packet switching controller that modifies the inbound packet transmits the outbound packet over the switching backplane to one or more of other packet switching controllers.
